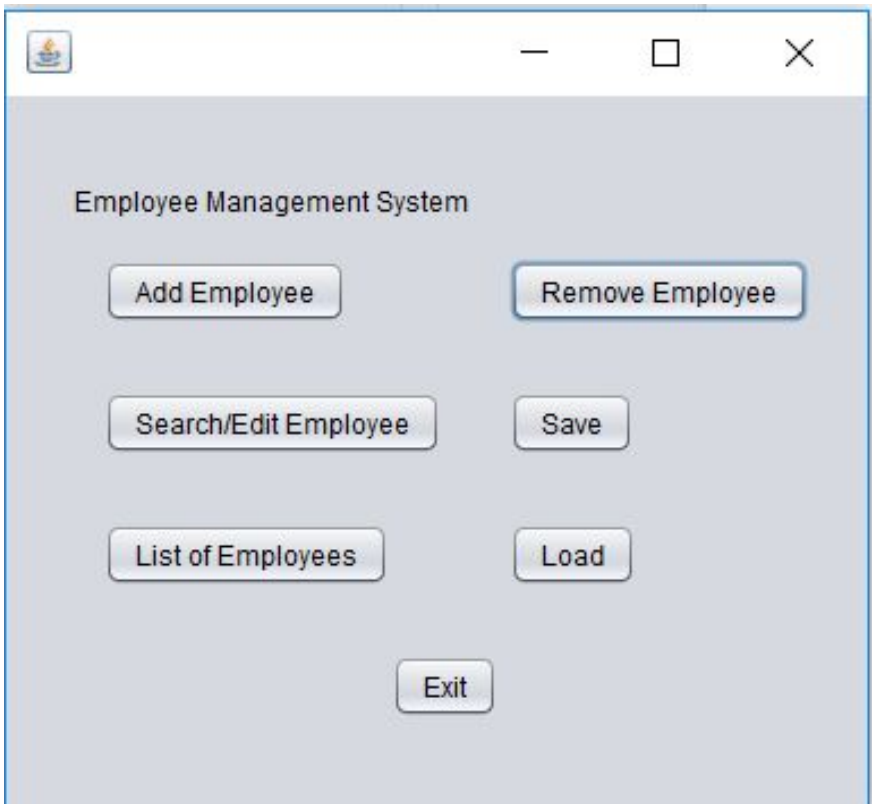
Employee Management System User Guide

Introduction

This employee management system is a program that allows you to store employees in an organized database. The program allows you to do the following: add, remove, search, edit, list, save, and load. This user guide will ensure that you as a user will be familiar with all these functions, by highlighting what each individual feature provides and how to use them.

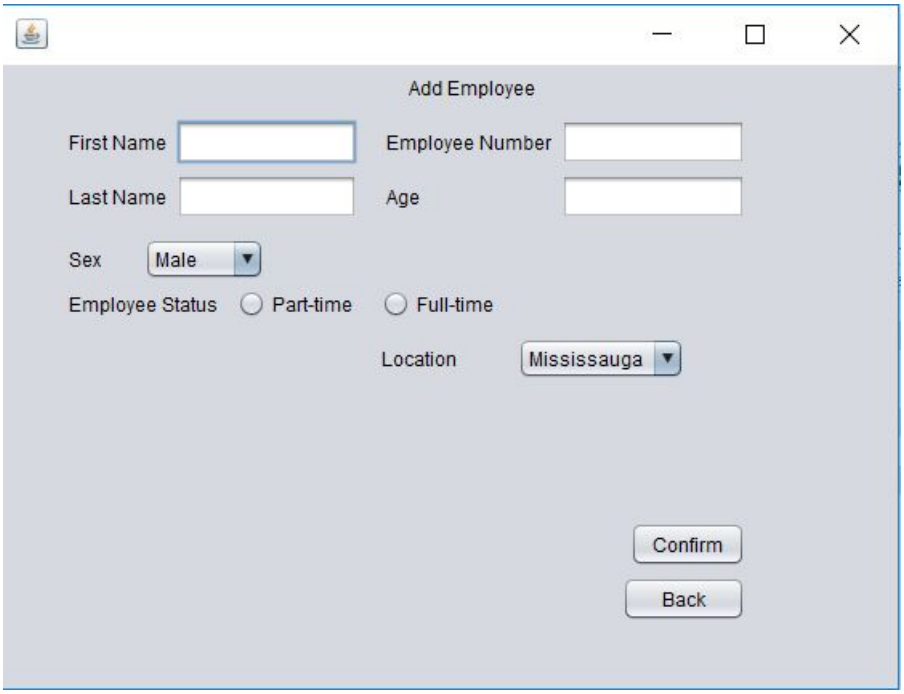
Startup

Upon running the program, you will be greeted to the home screen of the program. In this interface, you are given the option to select from a series of functions, or to exit the program.



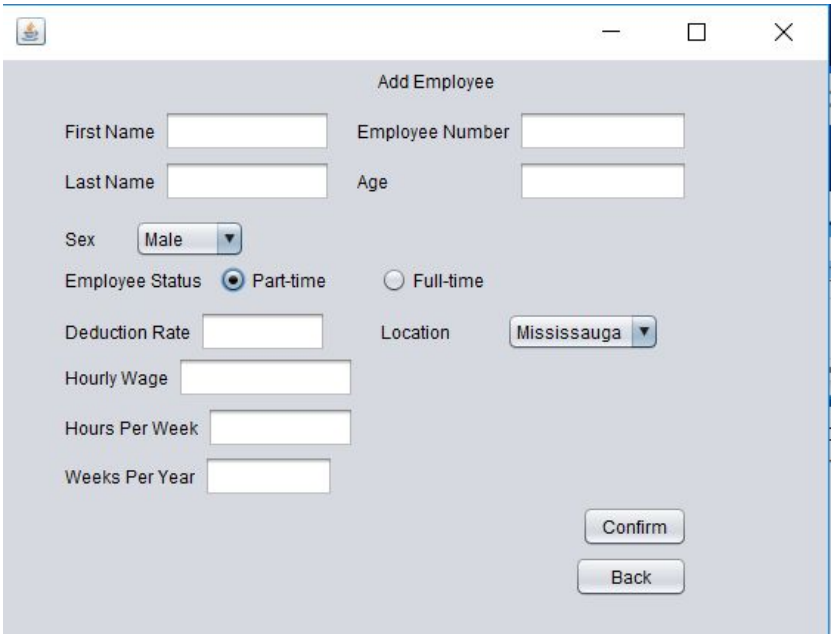
Add Employee

In order to add an employee, you must click on the button labelled “Add Employee” in the home screen. Afterwards, this interface will appear and the general required information for employees will be visible.

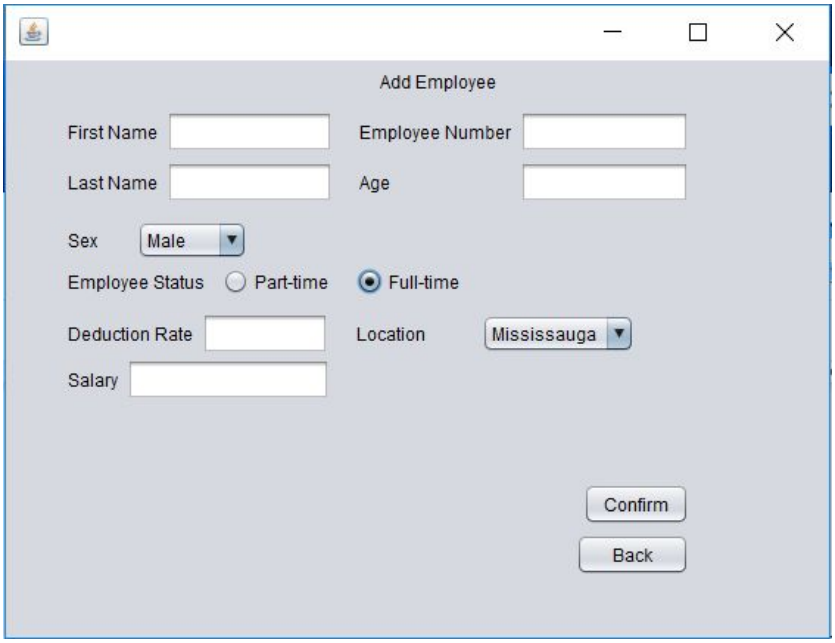


It is here that you will be able to input the information of the employee you wish to add to the program.

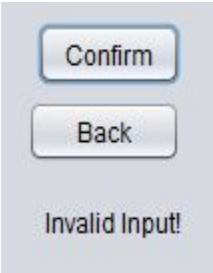
If the employee you wish to add is a part-time employee, selecting the part-time option in “Employee Status” will open another set of boxes that must be filled in. This information is exclusive to part-time employees.



If the employee you wish to add is a full-time employee, selecting the full-time option in “Employee Status” will also open a set of boxes that must be filled in. This information is exclusive to full-time employees.

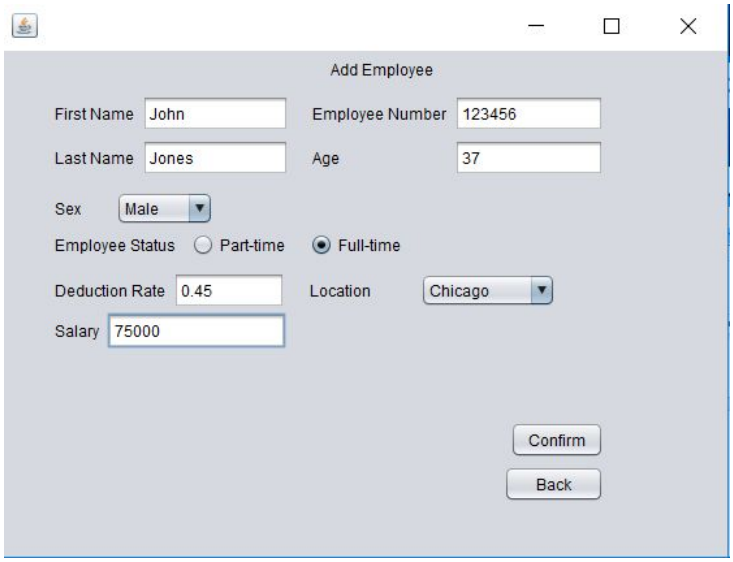


It is important to keep in mind that all boxes *must* be filled in; there are no optional information sections. Failure to do this will result in the notification “Invalid Input!” that appears when you press the “confirm” button. It is also important to ensure that all the boxes are *correctly* filled in. The following information must be inputted as numeric values: Employee Number and Age. For part-time employees, Deduction Rate, Hourly Wage, Hours Per Week, and Weeks Per Year. For full-time employees, the Deduction Rate and Salary.

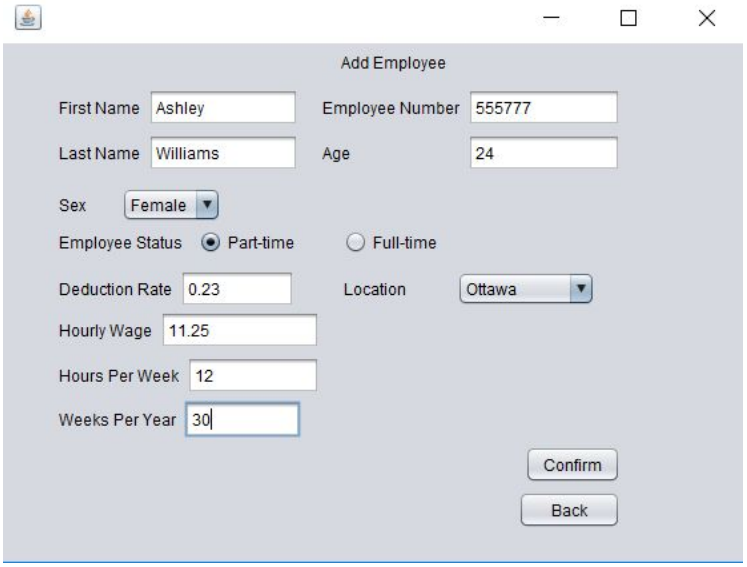


Failure to meet these specifications will also result in the error message on the right. No units are required for any of the numeric values stated. Deduction Rate for both part-time and full-time employees must be inputted as decimal percentage values, so a deduction rate of 23% for example must be inputted as 0.23. Hourly wage and salary are in dollars. As for First Name and Last Name, there are no specifications as to what characters are allowed and not allowed.

The following images are examples of inputs that would successfully add an employee to the system

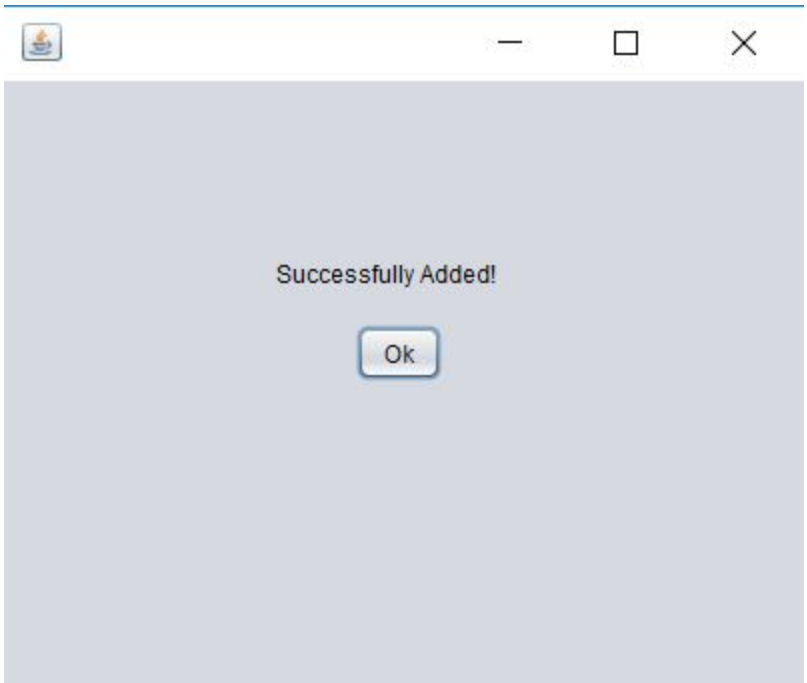


Full-time Employee Example



Part-Time Employee Example

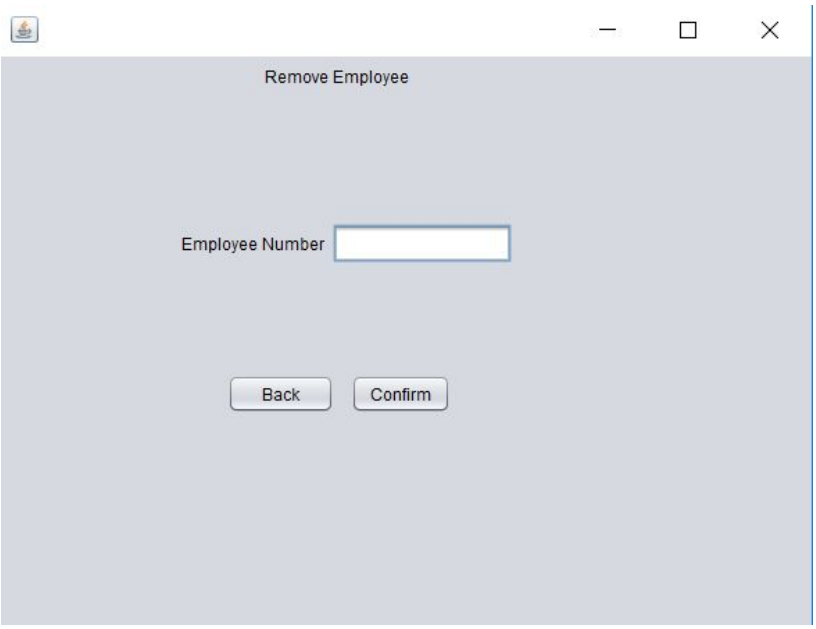
Once you have successfully added an employee, this pop-up window will appear, and clicking "Ok" will return you to the home screen.



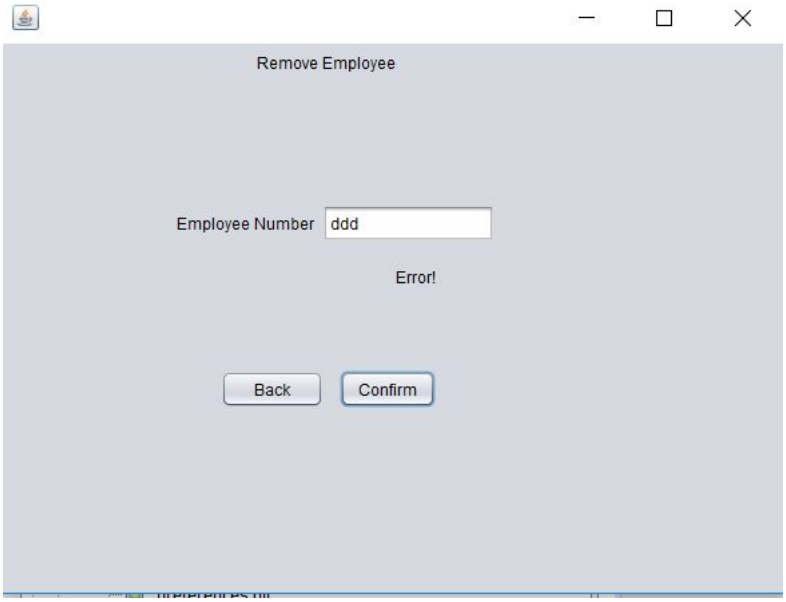
Note: If you decide to add another employee with the same employee number as a previous employee, it will overwrite the old employee!

Remove Employee

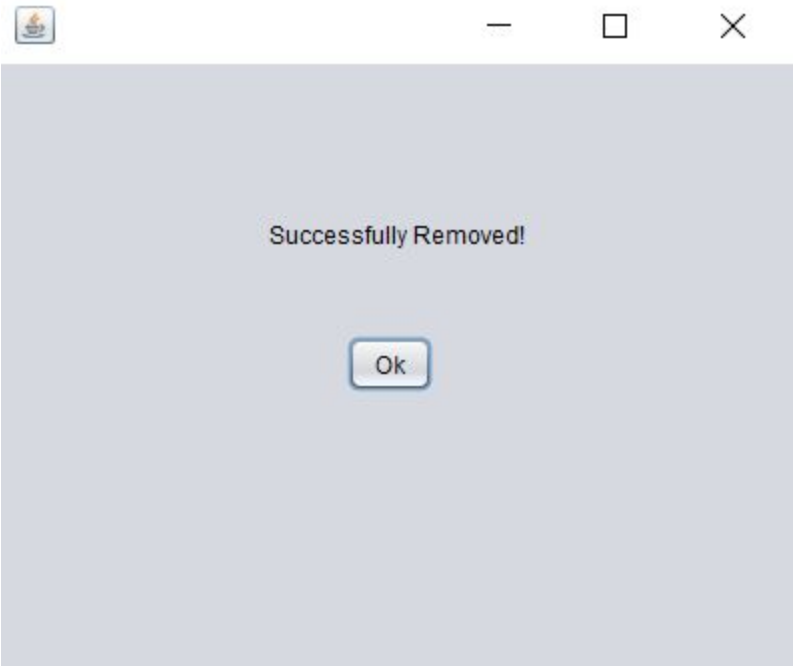
In order to remove an employee, you must click on the button labelled “Remove Employee” in the home screen. Afterwards, this interface will appear asking you for the employee number of the employee that you wish to remove.



The employee number must be a numeric value. If no employee number is inputted, or if the employee number includes strings as characters, there will be an error message that appears, labelled “Error!”, upon pressing the “Confirm” button.

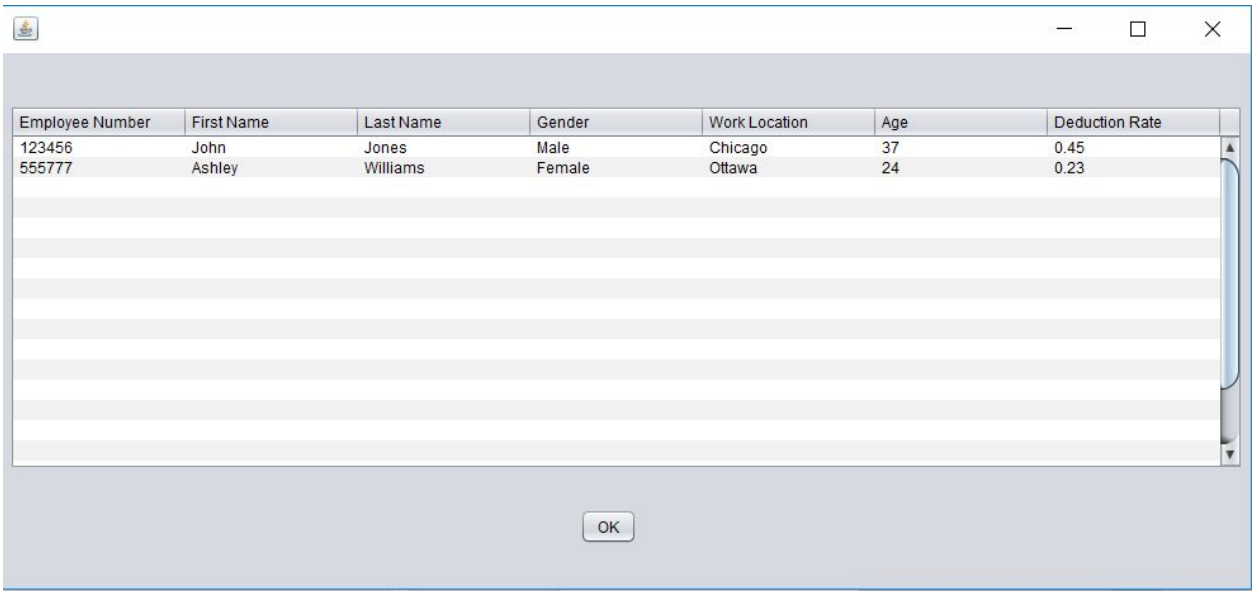


Once you have successfully removed an employee, this pop-up window will appear, and clicking “Ok” will return you to the home screen.



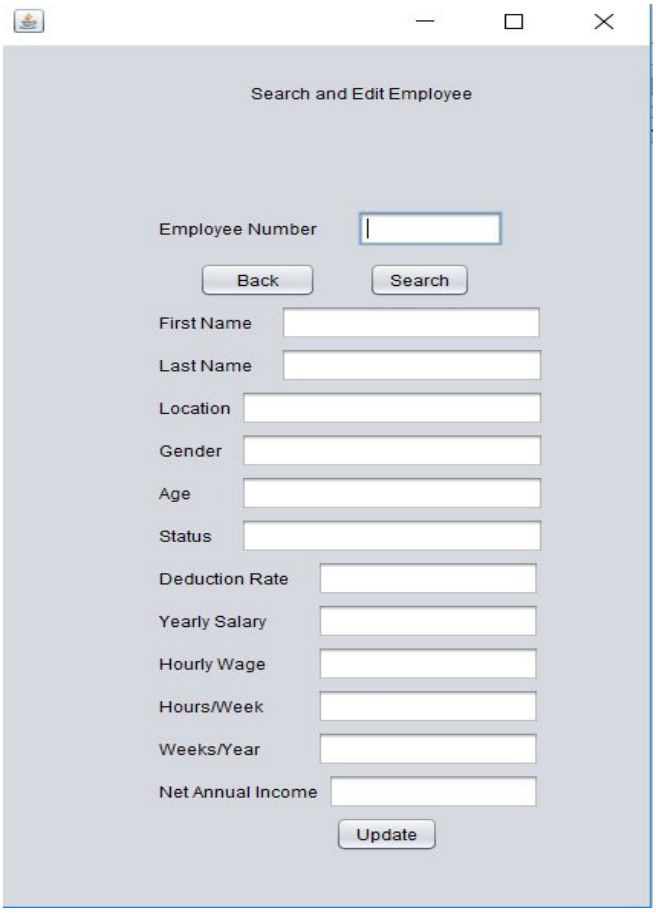
List Employee

In order to list the employees in the system, you must click on the button labelled “List of Employees” in the home screen. Afterwards, this interface will appear, providing the general information of all employees added to the system.



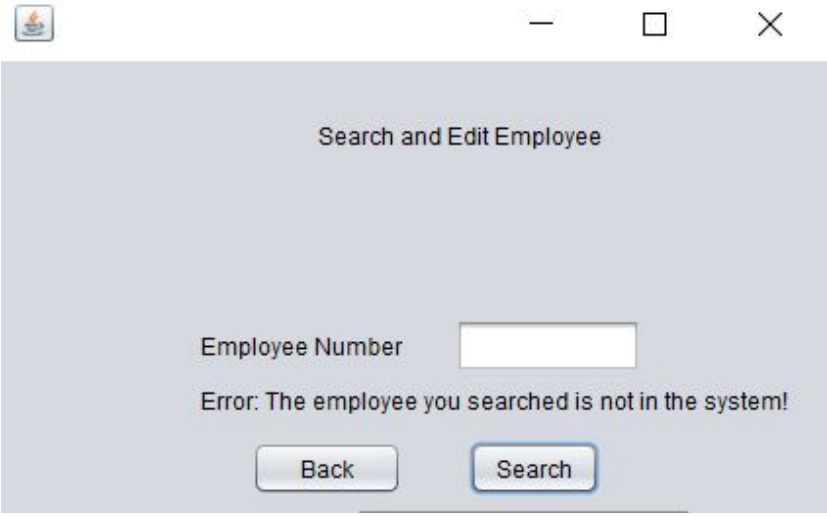
Search and Edit Employee

In order to search for the information of a specific employee, and/or edit that information, you must click on the button labelled “Search/Edit Employee” in the home screen. Afterwards, this interface will appear asking you for the employee number of the employee you wish to search and/or edit.



Entering any valid employee number will show the information for that employee. Depending on if they are a full-time or part-time employee, some information may be empty (as they are exclusive to full-time or part-time employees only). Once you enter the employee number, click the “Search” button.

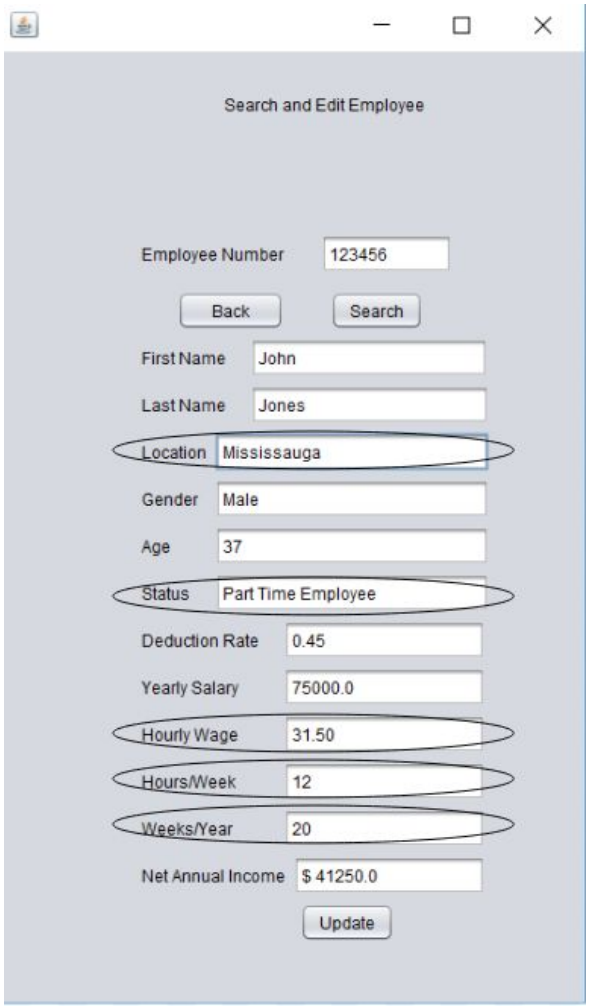
If you enter an empty employee number, or if the employee number doesn't exist in the system, the following error message will appear.



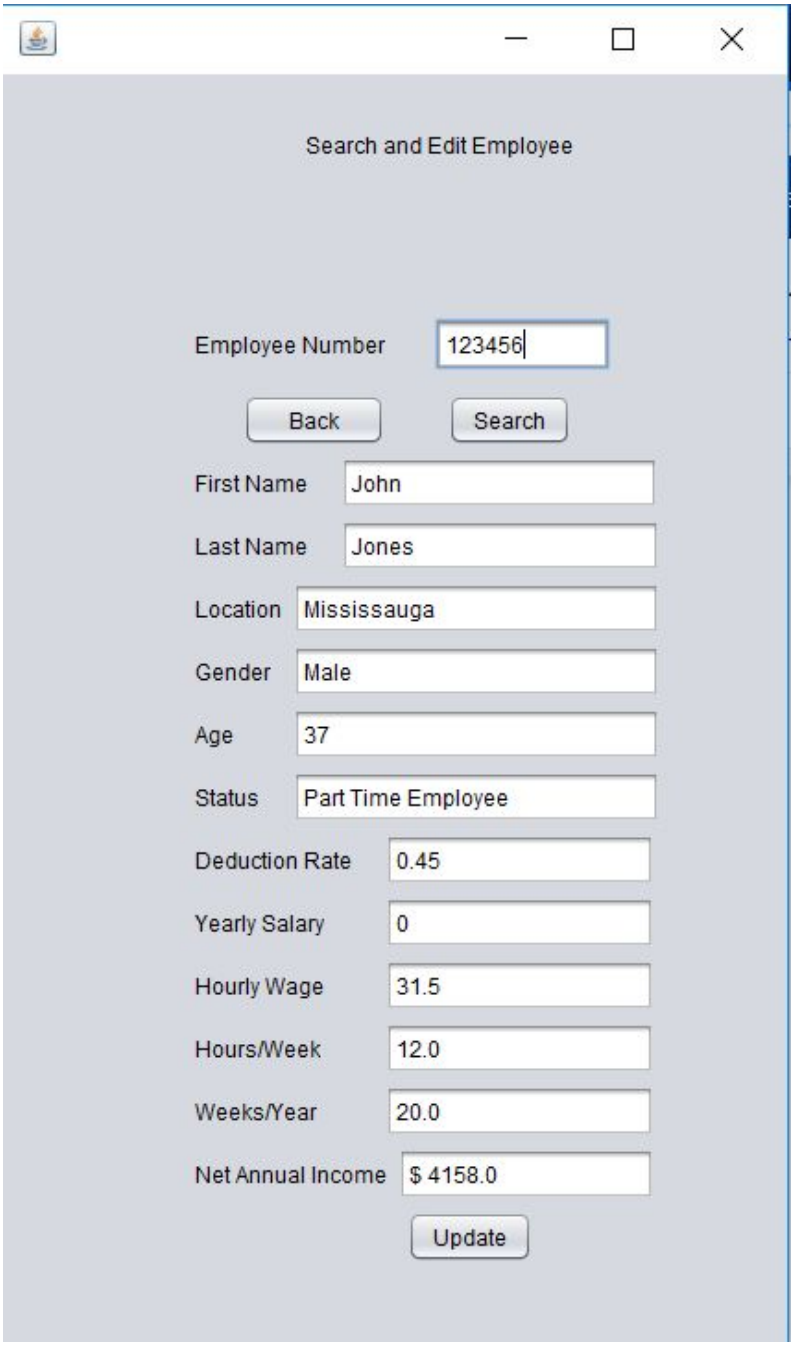
Once a valid employee number is searched for, the information for that employee will be shown.

If you wish to edit the employee: replace the information in the box with your updated information. Location is case sensitive, so it the input must be either “Chicago”, “Mississauga”, or “Ottawa”. Status is also case sensitive, so the input must be either “Full Time Employee” or “Part Time Employee”. Gender is also case sensitive; the input must be “Male”, “Female”, or “Other”. Note that you cannot update the Net Annual Income, as its value is based on a calculation using the employee’s other information, such as the deduction rate and hourly wage. Once you are done, click the “Update” button at the bottom.

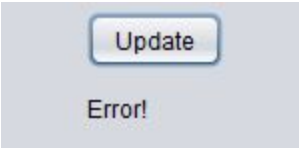
If you wish to update an employee from full-time to part-time, you can immediately update their exclusive information as well (i.e. Hourly Wage, Hours/Week, Weeks/Year or Yearly Salary). The following image is an example of this, with all new changes from the previous image above circled.



When these edits are updated, this employee will now display the following information when searched for. Notice how the yearly salary is changed to 0, and the Net Annual Income also changes because of the change from full-time to part-time.

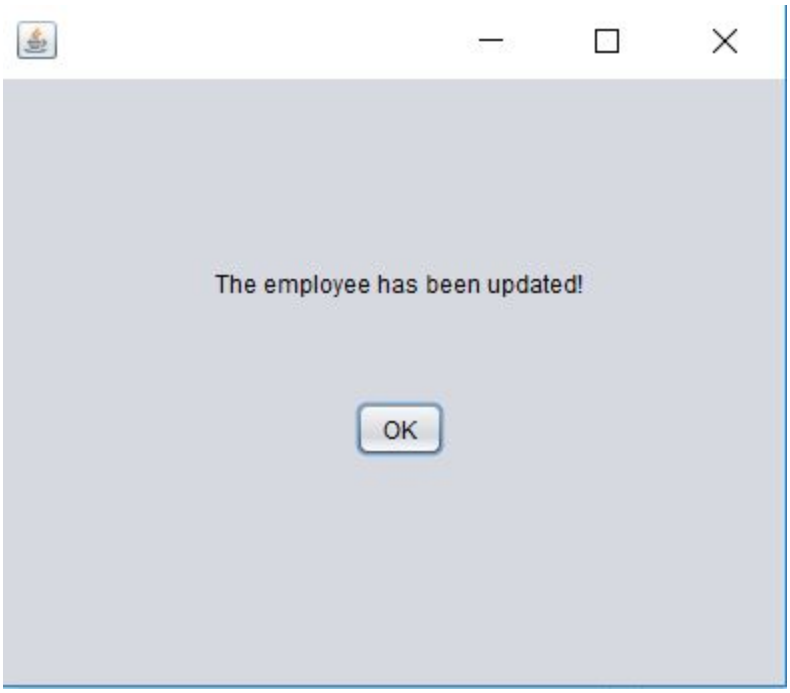


If there are any errors in the edits, then this error message will appear



These errors can be the result of information left blank, or incorrect input values. **Keep in mind, age, hourly wage, deduction rate, yearly salary, hours per week, and weeks per year are *all* numerical values.**

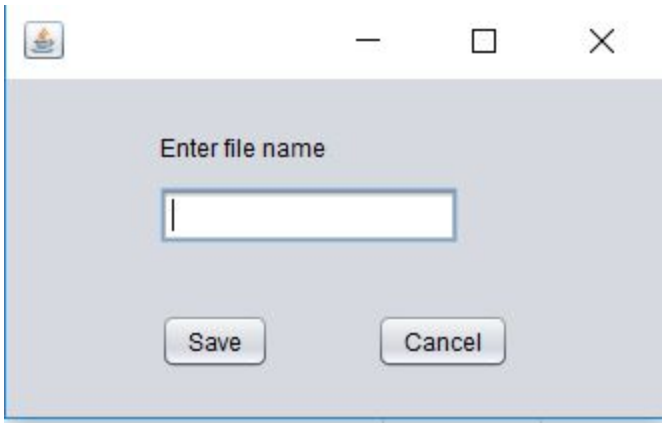
Once you have successfully edited an employee, this pop-up window will appear, and clicking "Ok" will return you to the home screen.



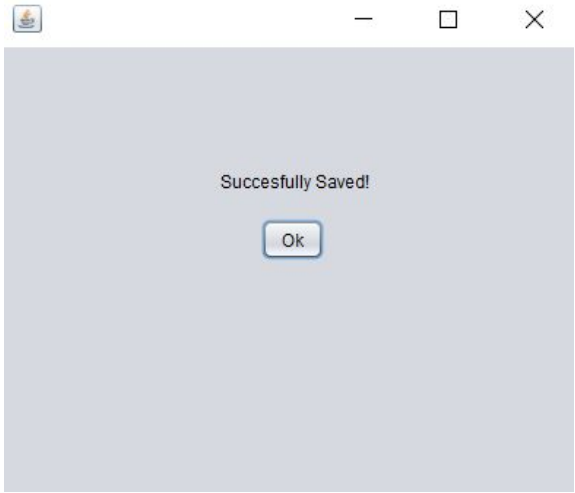
Note: If you have a full-time employee (or part-time) and you try to update information exclusive to the other type of employee (e.g. hourly wage for full-time employees), although the edit will appear successful, it will not save the hourly wage to the employee as that is not an attribute for full-time employees, so if you were to search for the same employee again, it will still show the hourly wage as 0.

<u>Save</u>

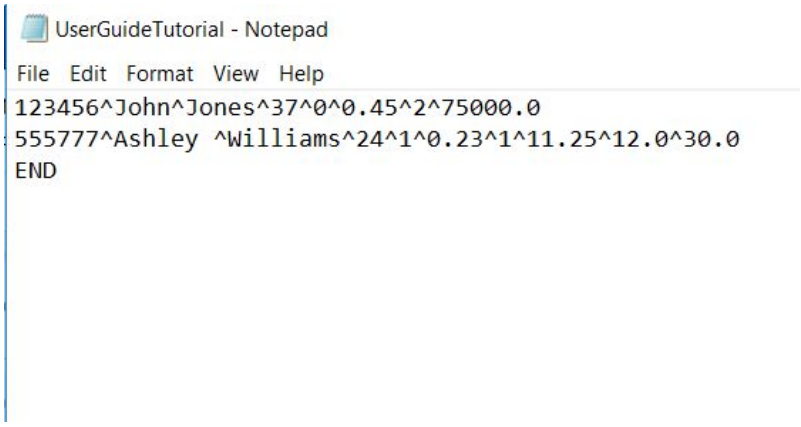
The save function allows you to save the current list of employees to a separate notepad file on your PC. In order to save your database, you must click on the button labelled "Save" in the home screen. Afterwards, this interface will appear asking you to name the saved file.



Once you have successfully saved an employee, this pop-up window will appear, and clicking “Ok” will return you to the home screen.

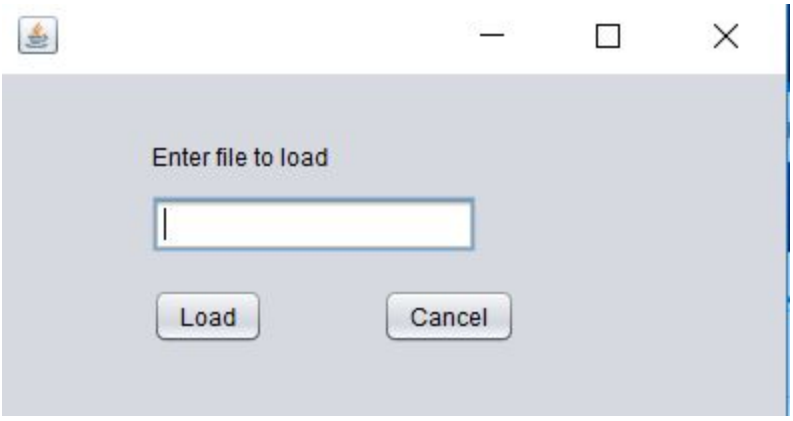


Below is an example of what the saved notepad file looks like. This file not meant to be informative on it’s own, but loading this file back into the employee management system will import all saved employees into your program.

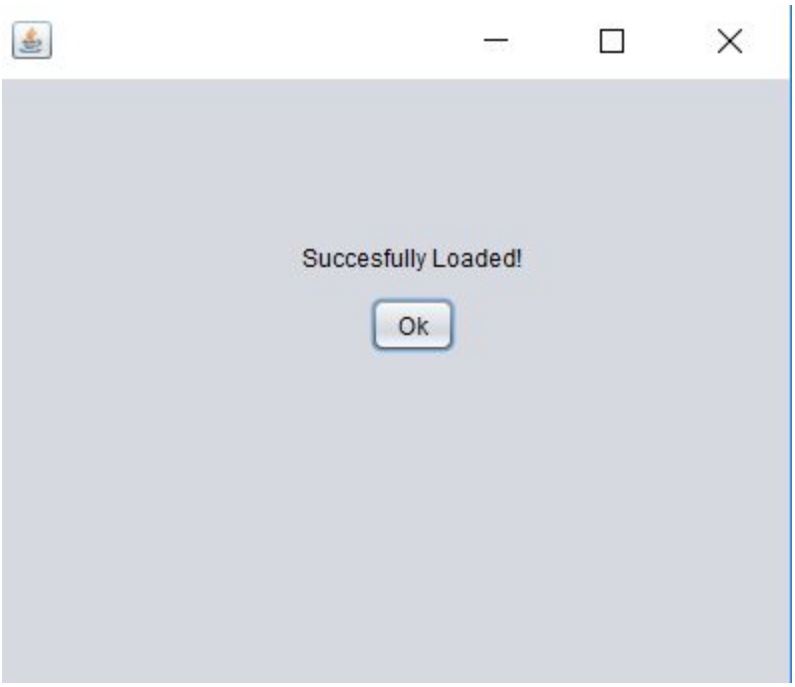


Load

The load function allows you to load a saved list of employees into the program. In order to load your database, you must click on the button labelled “Load” in the home screen. Afterwards, this interface will appear asking you to input the name of the file you wish to load.



Once a file has been successfully loaded, you are able to use the list of employees from that file in the employee management system. This means that you can further add or remove employees, edit existing employees, etc. This pop-up window will appear confirming a successful load.



Note: Loading a non-existent file will appear successful, but nothing will actually be loaded.
